Identification of the HCRTR2 nucleic acid molecule permits the diagnosis of narcolepsy. A method from the present invention is provided for treating narcolepsy by administering to the individual an isolated HCRTR2 treating narcolepsy by administering to the individual an isolated HCRTR2 receptor. The diagnosis of narcolepsy been nucleic acid in a therapeutically effective amount so that the cells produce native HCRTR2 receptor. The diagnosis of narcolepsy has been difficult to differentiate from other conditions such as chronic fatigue syndrome or other sleep disorders but detection of HCRTR2 nucleic acid makes it possible to accurately diagnose narcolepsy. AAH21541 to AAH21612 represent primers used in the identification of the narcolepsy gene in an example from the present invention. AAH21613 represents the HCRTR2 gene which encodes the HCRTR2 protein given in AAB98007
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gene for hypocretin (orexin) receptor 2 (HCRTR2) which is associated with narcolepsy, useful in methods of diagnosis of narcolepsy and pharmaceutical compositions for therapy.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

the fluorescent protein to be directed to a different cellular comparation to be directed to a different cellular comparation after cleavage of the protein cellular change in distribution of the fluorescent protein can be detected using imaging methods with a high degree of spatial resolution. The methods and biosensors of the invention can be used to investigate a wide range of cellular activities and to screen compounds which modulate these activities. Biosensors containing a recognition site for caspase, for example, may be used for the screening of compounds which modulate apoptosis, while biosensors containing of their protease recognition site apoptosis, while biosensors containing of compounds which modulate and be detection of proteolytic toxins (such as anthrax length of the detection of proteolytic toxins (such as anthrax candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature in the compound optimisation and computer-based feature.
                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                 extraction, data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug cardidates. Sequences AAA93177-A93411 and AA93340 represent protease recognition sites (AAB22886-B22220, AAB22988) which may used as components of biosensor fusion proteins of the invention

The present sequence is that of DNA encoding the substrate recognition sequence (see AAY79598) of caspase-8. The DNA is used in a claimed recombinant nucleic acid encoding a protease biosensor. The nucleic acid (see AA277627-43) comprises: (1) a sequence (see AAA27568-76) encoding at least 1 detectable signal polypeptide; (2) a sequence (see AAA275-611)

Recombinant nucleic acid encoding a protease biosensor useful for fluorescence based cell and molecular biochemical assays for drug discovery comprising three operably linked nucleic acid sequences.

WPI; 2000-365644/31. P-PSDB; AAY79598. Claim 6; Fig 29B; 218pp; English.

that encodes at least 1 protease recognition site, such as the present sequence; and (3) a sequence (see AAA27611-26) that encodes at least 1 reactant target sequence. An expression vector, a genetically engineered host cell and a recombinant protease biosensor are also claimed. A claimed method for identifying compounds that modify protease activity in a cell involves contacting a host cell that possesses the recombinant. CC protease biosensor with a test compound, and determining the protease consons with a test compound, and determining the protease consons of alstribution in the host cell, where changes in the correlation of the protease biosensor are correlated with modification of distribution of the protease activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the recombinant nucleic acid, or the recombinant protease biosensor, or the content screens to detect in vivo activation of enzymatic activity, and cotific activity based on cleavage of a known recognition contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for amplifying a DNA fragment. The method comprises successive repetitions of heat-denaturing, annealing of a primer and an extending step using a DNA polymerase. The method makes uses of a cDNA pool in which the primer is one primer or a pair of primer sets and has an amplification probability which allows it to amplify a DNA fragment from a limited number of the cDNAs among the DNA pool (where the limited number of the cDNAs among the DNA pool (where the limited number is in the range of 1 to 25). Also included in the invention are apparatus used for carrying out the method, a primer and a DNA polymerase and a kit used for carrying out the method, a primer and a be used to amplify a limited number of cDNAs from a pool in which a wide variety of cDNAs are present. Oligonucleotides AAC37775 - AAC97990 represent primers used in an example illustrating the method of the

The specification describes a method for the determination of the nucleotide sequence of a polynucleotide. The method comprises providing a set of primers in which each primer has an extension region containing a terminal nucleotide, a template arranging segment and at least one complexity-decreasing nucleotide, forming a template containing primer-combining sites and the polynucleotide in which the primer-combining an amplicon from the template by amplifying a double-stranded DNA formed selectively by extending the primer from the set in which the extending region forms a double-strand completely matched to primer-combining sites of the terminal nucleotide of the extending region of the primer by an identification of the amplicon, shifting the region of the primer by an identification of the amplicon, shifting the primer-combining sites of the terminal mucleotide of extending the primer-combining sites of the template, and repeating this until the nucleotide sequence of the polynucleotide is determined. The method can be used for DNA sequencing. The present sequence represents a primer contains an expension by a primer combining sites of the polynucleotide is determined. The
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biological functions. The methods of the invention of all last to didetector molecules which, when acted on by a compound of interest, cause an alteration in the cellular distribution of at least the fluorescent moiety. In one embodiment, the biosensors comprise heat shock proteins (HSPs) fused to a fluorescent protein (e.g., jellyfish green fluorescent protein (GFP), or derivatives thereof). Such biosensors are located in the cytoplasm, but on stress activation translocate to the nucleus In another embodiment biodetector proteins can be used to detect protease critical activation signal, which is cleaved by the protease; and at least one cellular localisation signal. The latter two components may be components of a single protein which is acted upon by the protease, or may be from heterologous sources. Due to the localisation signal, the biodetector protein is localised to a particular fluorescent protein is cleaved from the localisation sequence, and is fluorescent protein is cleaved from the localisation sequence, and is free to migrate to other locations within the cell. The presence of a

A method has been developed for the amplification of a DNA fragment in which amplification is carried out on the DNA fragments of a number of different DNAs. The method comprises a PCR reaction repeatedly carrying out a heat-denaturing step, a primer annealing step and a polymerase extending step, to amplify the DNA fragments of a plural of different DNAs. The method can detect the existence of a microbe in organic waste. AAZ41424 to AAZ41639 represent PCR primers used in random amplified polymorphic DNA arbitrarily primed PCR, for the detection of microbes in

RESULT 198

```
This invention describes a novel method for the amplification of DNA comprising (i) preparing many primers (P) with different probabilities of amplification and (ii) simultaneous polymerase chain reaction (PCR) of different DNA using these primers. The method is used (i) to differentiate between different microorganisms in a mixed population and (ii) to determine presence/absence of an impurity (pollutant), or its concentration, in e.g. soil, foods, compost etc., typically metals, agricultural chemicals, polymers, organochlorine compounds etc. A particular use is monitoring composting of organic material.

Amplification with many primers produces a lot of information, so reliability of the test is improved, and many samples may be tested quickly. AAZ1640-Z41855 represent the primers described in the method of the invention. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extension of DNA using rolling primer - useful as DNA sequencing method
                                                                                                                                                                                                                                                                                                Novel polymerase chain reaction method, for differentiating between microorganisms and for detecting contaminants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extension region; terminal nucleotide; template arranging segment; complexity decreasing nucleotide; DNA sequencing; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is homologous to that upstream of the interleukin-2 gene, in the enhancer region. DNA sequence analysis of the promoter/ enhancer regions of several genes that respond to T-cell activation signals has identified putative NF-AT protein binding sites. The oligonucleotide, and ones homologous to it, may be used in methods for screening immunosuppressive agents. See also AAQ37029-35. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunomodulatory agents screening compsn. for immunosuppressant tests -comprises isolated transcription factor binding nucleic acid sequence of 20 base pairs and polypeptide activating NF AT dependent transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amplification; polymerase chain reaction; PCR; microorganism; compost; detection; pollutant; soil; food; agricultural chemical; polymer; organochlorine; primer; ss.

ö The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from synession. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmettic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ87680) of the invention The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (GAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin discorders, specifically neurodermatitis; sunburn; psoriacis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the (ESI) of the invention In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer. Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST, expressed sequence tag, ss. It can be prepd by solid phase triester or phosphor-amdite chemistry or by recombinant DNA techniques. It can be used for treating infection by herpesviruses, e.g. herpes simplex type I (HSV-1) and type (HSV-2), varicella zoster (VSV), Epstein-Barr (EBV), cytomegalovirus (CNV), human herpesvirus growth or replication may indirectly forestail the progression of events from HIV exposure to the clinical manifestation of AIDS: It may also be useful in the detection, diagnosis and manipulation of herpes virus. See also AAQ23764-Q22788 and AAQ24014- (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New anti:sense oligo:nucleotide(s) for inhibiting HSV - also used for diagnosis and for inhibiting HIV activation by herpes virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

oligonuclectides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for traplication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triplendelices with such sequences in cancervus cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the

```
The invention relates to a peptide nucleic acid capable of hybridising to a target sequence of Mycobacterial rDNA, precursor rRNA or rRNA (5S, 16S or 23S) forming detectable hybrids. Also included are detecting a target sequence of mycobacteria in a sample comprising contacting at arget sequence of mycobacteria in a sample comprising contacting at rarget or the probability of probes (hybridisation takes place between the probe and the rRNA or rDNA, observation or measurement to formed detectable hybrids are rDNA, observation or measurement to the presence of a target sequence of mycobacteria in the sample, and a kit for detecting a target sequence of mycobacteria in particular a target sequence of mycobacteria in particular a target sequence of mycobacteria in particular a target sequence of mycobacteria of MTC (and distinguishing them from mycobacterium other than tuberculosis. MOTT) present in a sample, e.g. sputum, laryngeal swabs, gastric lavage, bronchial washings, biopsies, aspirates, expectorates, body fluids, curne, tissue sections as well as food samples, soil, air and water samples and their cultures. The probe is able to penetrate the cell wall of the mycobacteria. It is able to hybridise to Mycobacterial precursor rRNA and rRNA without harsh treatment of the mycobacterial precursor therefore avoiding a risk of interfering with the morphology of the cells. The present sequence is an N. avium mutated probe for 235 RNA around positions 2568-2569, associated with 235-mediated macrolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

activity of CYP7A1, and the binding affinity of candidate drugs targeting dry7A1 for the treatment of disorders such as cholesterol and bile disorders. Haplotyping methods are useful in validating CYP7A1 as a candidate target for treating a specific condition or disease predicted to be associated with CYP7A1 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with CYP7A1 activity, such as cirrhosis, familial hypertally veridated activity, such as cirrhosis, familial hypertally veridated activity, such as cirrhosis, familial hypertally veridated and hypercholesterolaemia. Transgenic animals are also useful for studying expression of the CYP7A1 isogenes in vivo, for in vivo screening and testing of drugs targeted against CYP7A1 protein, and for testing the efficacy of therapeutic agents and compounds related to cholesterol and bile acid metabolism. The present sequence represents and compared condition to an allele-specific oligomorelectide (ASO) probe, used in the invention to

The invention relates to a novel polymorphic variant of a sequence of CYPA1 protein or its fragment. The polymorphic has hepatotropic and antilipaemic activity. The polymorphic variants are useful in studying the expression and function of CYPA1, in expressing CYPA1 protein for use in screening candidate drugs to treat diseases related to CYPA1 activity, in studying the effect of the variation on the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 16; Page 21; 84pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
```

The invention relates to an isolated polynuclectide comprising genes and haplotypes of the Chemokine binding protein 2 (CCBP2) gene. Polymorphic variants of the CCBP2 gene are useful in studying the expression and function of CCBP2, and in expressing CCBP2 proteins for use in screening candidate drugs for treating diseases associated with CCBP2 activity. Polynucleotides comprising a polymorphic gene variant or fragment may be used for therapeutic purposes, where a particular CCBP2 protein isoform, expression or increased expression of a particular CCBP2 protein isoform, or an expression vector encoding the isoform may be administered to the patient. Haplotype information is useful in improving the efficiency and output of several steps in drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. The polynucleotides of the invention can be used to treat disorders related to the CCBP2 gene by gene therapy. This . 0 Human, CYP7A1; hepatctropic, antilipaemic; cholesterol disorder; cirrhosis; bile disorder; hypertriglyceridaemia; hypercholesterolaemia; cytochrome P450, subfamily VIIA, polypeptide 1; probe; ss. New cytochrome P450 subfamily VIIA (cholesterol 7 alphamonooxygenase) polypeptide 1 gene variants, useful for studying the expression and activity of CYP7Al and screening drugs for treating disorders of cholesterol and bile metabolism. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV tribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) inbozyme. Note: Some of the sequence data for this patent did not form part of the princed specification. The complete sequence data for this patent was constant of the at the constant of the unit of the constant of the unit of the at the constant of the unit of the at the constant of the unit of the at the constant of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chemokine binding protein 2; CCBP2; CCBP2 protein isoform; gene therapy; polymorphic gene variant; single nucleotide polymorphism; human; primer; PCR; ss.
                                                                             New ribozymes targeting RNA derived from hepatitis C virus inhibit vireplication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genetic variants having polymorphisms in the chemokine binding protein 2 (CCBP2) gene, useful for studying CCBP2 functions, and for treating disorders affected by expression or function of the CCBP2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein, gene and cDNA sequences of human P650 (dytochrome) oxidoreductase POR, and single nucleotide polymorphisms (SNPs) identified therein. The sequences can be used to haplotype the POR gene of an individual, and to establish whether POR is a sultable target for drugs to treat cancer and disorders associated with impaired protein synthesis in cells. The present sequence is an allele specific primer for the coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genetic variants comprising haplotypes of the P450 (cytochrome) oxidoreductase (POR) isogene, useful in improving the efficiency of drug screening protocols for compounds targeting POR.

                                                          The patent discloses methods and compositions for killing or inhibiting growth of bacteria comprising contacting the bacteria with a peptide nucleic acid (PNA) complementary to a region of the bacterial ribosomal RNA. The method is used to treat a bacterial infection in a mammal and as a disinfectant. The present sequence is a duplex forming peptide nucleic acid (PNA) which is targetted to Escherichia coli ribosomal RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; colon cancer; colorectal cancer; pancreatic cancer; SAGE tag; serial analysis of gene expression; diagnostic; prognostic; probe; cancer marker; ss.

The specification describes a method for determining target gene function in bacteria. The method comprises providing a nucleotide sequence of the target gene from the bacteria, selecting and preparing PNAs with regions complementary to a part of the nucleotide sequence, in anti-parallel orientation, determining activity of PNA selected assay to identify active PNA compounds, contacting the bacteria with the active PNA compounds, contacting the bacteria with the active PNA compounds of these on the bacteria. The method is useful for determining the function of target gene in a bacteria. The method is also useful in the design of antisense antibacterial drugs and gene function analysis in bacteria. The method is used for killing or inhibiting of
neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining bacterial target gene function, involves preparing peptide nucleic acid (PNA) compounds complementary to bacterial nucleotide sequence, determining activity of PNA, contacting active PNA compounds and determining the effect.

this invention describes a novel isolated genes and haplotypes of the human aldehyde dehydrogenase 5 (ALDH5) gene containing polymorphic sites. The polymorphic ALDH5 variant is useful in studying the effect of the variation on the biological activity of ALDH5 and on the binding affinity of candidate drugs targeting ALDH5 for the treatment of alcoholism and alcohol-induced disorders. Polymucleotides comprising a polymorphic gene variant or fragment may be used for the treatment of alcoholism and isoforms may be used in assays to measure the binding affinities of one correction to the same that a protein a protein such a section of a section of the same and a polymorphic gene variant or fragment and a polymorphic gene variant or disease predicted to be used by scientists to validate ALDH5 as a candidate target for treating a specific condition or disease predicted to be associated with ALDH5 activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with applied for studying the biological function of ALDH5 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. The products of the invention have antialcoholic activity. This sequence represents a human and a plant of the disclosure of the
                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genetic variants with polymorphisms in the aldehyde dehydrogenase 5 (ALDHS) gene, useful for studying the function of ALDHS, and for expressing ALDHS protein which is useful in screening drugs for treating ALDHS-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ALDH5; human; gene; polymorphism; haplotype; aldehyde dehydrogenase 5; binding affinity; drug targeting; alcoholism; alcohol-induced disorder;

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 67; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antiense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell profiferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligomic estimates the present invention (see ARP45151 and AAP45153-6150.). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,

kin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, inchthyosis, pityriasis, ruba, pilaris, serborrhoea, concers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; Keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hypermeovascular condition; hyperplama; kidney disease; neoblation of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                        present invention relates to a method for ameliorating the effects of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                   skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-Ike Growth Factors [IGFP]-1 receptor, IGF binding protein [IGFPB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAA45153-845161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pllaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy, antiproliferative, antinflammatory; antipsoriatic; cytostatic; dermataclogical, catdiant; vitudide; ophthalmological, kaloid; skin disorder; Insulin-11ke Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthytosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antiscence oligomucleotide, (for Insulin-like Growth Factor [IGF]. receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, tuda, plaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant; virucide, ophthalmological, keloid, skin disorder, insulin-like Growth Factor I receptor; IGFF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keardosis; neoplasia; sclaroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; byperplasis; kidney disease; neovascular condition of the retina; ss. This invention relates to hybridisation probes which target a specific sequence within a large double-helical nucleic acid. The probe is complementary to the target sequence and contains at least one nucleotide with an attached molecule that is able to cleave double-helical DNA e.g. EDTA-Fe(II) (ethylenediaminetraacetic acid-iron complex). The probes where the attached molecule is a label or compound that alters gene expression, are used for specific detection and/or cleavage of double-helical DNA, e.g. for diagnosis, for treatment of disease (particularly caused by viruses, genetic defects or oncogenes), for chromosomal analysis, and for the isolation and mapping of genes. The present sequence represents probe of the invention which is used in an example illustrating how it binds to and cleaves a double stranded fragment of plasmid pDMAGIO given in AAH20315
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; Keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                  New hybridization probe for specific triplex formation with large double helices, useful e.g. for site-specific diagnostic cleavage, contains attached functional residue.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an skin disorders. The method comprises contacting the skin with an creeptor, IGP binding protein [IGPP]-2 or IGPPP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, rothyyosis, pityriasis, ruba, pilaris, servorthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperplasia alignancies, other sclerotic diseases, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy; antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scaleroderma; wart; skin cancer; sclerotic disease; hyperancovascular condition; hyperplasia, kidney disease; neobascular condition of the retina; ss.
                                                                                                                                                                                                             Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a dendrimer having branches that terminate with the same polynucleotide (PN) sequence. Also described are: (1) use of a multimeric PN for hybridisation interaction; and (2) an assay for a target PN by hybridisation with an immobilised PN, which comprises the preliminary step of conjugating the target to a dendrimer having reactive terminal groups. The dendrimers comprising PN multimers can be used in hybridisation assays for the detection of target nucleic acids. The use of multimeric PNs allows multiple hybridisation reactions to occur with a resulting increase in the stability of the hybridised components compared to a duplex formed between PN monomers. This increase in stability is characterised by higher melting temperatures and higher temperatures of reassociation exhibited by the multimeric PNs in comparative tests with PN monomers. The present sequence represents a control polymucleotide sequence, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the HepatitisC virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to the use of a triple-helix forming oligonacleotide for in situ detection of a double-stranded target nucleic acid sequence. The method can be used to detect a genetic disorder e.g. to detect an extra or missing chromosome or fragment or aneuploidy, especially for detecting an extra or missing chromosome 17 or 21. The method can be also be used to screen for individuals at risk of developing a disease or for diagnosing an infectious disease. The use of triple helix forming oligonacleotides allows in situ detection of double stranded target sequence as opposed to prior art uses of developing potential anti-gene therapeutic agents or artificial restriction endonucleases
tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-11815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel use of triple helix forming oligonucleotides, useful for in situ detection of double stranded target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The PNA is targeted to messenger or ribosomal RNA. The antibacterial composition has bacteriostatic and bacterial properties. The PNA can be used to treat a mammal suffering from a bacterial infection where the PNA is complementary to a region of ribosomal RNA and of mRNA of the bacteriar. Further treatment may include concurrent treatment with an antibiotic. The PNA can also be used as a method of disinfection by selecting an object to be disinfected, contacting the object with PNA (in solution) and rinsing the object with a serile liquid to remove the PNA. The invention provides new ways of tackling bacterial infections which have become resistant to frequently used antibiotics. The present sequence represents a PNA from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= b /note= "t is attached to an amidated lysine residue e.g. -t-Lys-NH2"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Killing or inhibiting bacterial growth by using a peptide nucleic acid.

Hepatitis C virus.

Pavco PA, Macejack D;

```
The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirthosis, liver failure and/or hepatocellular carcinoma. The HCV infoction in conjunction with one or more condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hairpin (HP) ribozyme. Note: Sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                           New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Match

                                                                                                                                                                                                                                                     The present invention relates to novel double stranded (ds) DNA sequences which can interact with a third strand to 0 form a stable triple helix. The invention also relates to a method for purifying a ds DNA molecule, comprising contact with a third DNA strand that interacts with a target agequence (TS) in the ds DNA to form a triple helix. The present sequence is an oligomucleotide from human alpha foetal protein gene, used as the ds DNA sequence in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, in both. The tag sequences can be used to identify genes by matching

The present sequence represents a polynucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methyloytosine for increased triplex catability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test comprises adding a sample containing double-stranded DNA test comprises adding support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting concogenes and Hepatitis B virus

The present sequence represents the preferred target sequence of an erzymatic nucleic acid, especially a hairpin ribozyme, which cleaves the Hepattiis C virus (HCV) RNA sequence at the base position given in the Gescriptor line. The HCV sequence was screened for optimal ribozyme cleaves the the HCV sequence was screened for optimal ribozyme trayer such contained potential continued proceedings of the mine of the meant of the secondary folding structures and contained potential cribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatoticis C virus (HCV) infection, e.g. cirrhosss, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune contains and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

transforming growth factor beta-1 (TGF beta-1). The oligonucleotides transforming growth factor beta-1 (TGF beta-1). The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that contain 8-30 nucleotides which contain at most 8 nucleotides that consecutive nucleotides able to form three H-bonds each to four consecutive orytosines, do not contain two sequences of three consecutive cytosines, and the ratio between residues able to form two H-bonds each consecutive nucleotides each able to form three H-bonds to three consecutive nucleotides are used to modulate expression of genes, particularly colligonucleotides are used to modulate expression of genes, particularly proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
beta 1. The sequences given in GENESEQ files AAQ78408-78487 are antisense oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate analogues. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              beta-1; TGF beta-1; antisense oligonucleotide; ss.

Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of

                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

They are used especially for the treatment of the immunosuppressive effect of TGF-beta, augmentation of the proliferation of cytocoxic lymphocytes, treatment of endogenous hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas and malignant gliomas, including glioblastomas, treatment and prophylaxis of skin carcinogenesis, and treatment of ossophageal and gastrif carcinomas. See AAQT8352-Q78488. The sequences given in GENESEQ files AAQT8352-Q78407 and AAQT888 are antisense oligodeoxynucleotides of TGF-
The sequence is that of a polymucleotide probe which may be used in the detection of new hypervariable regions (HVR) in a DNA sequence. HVR represent a fingerprint useful in e.g. forensic science, paternity testing, animal breeding, etc. The probe may be used as part of a method for the efficient detection in humans or other animals, without the use of mini-satellites or primary enrichment. Oligonucleotide SEQ ID NO 263069 for detecting SNP TSC0063818

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABF82073 fat for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                           Set of oligonuclectides, useful for diagnosis and cell typing, i designed to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps
Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .gonuclectides, useful for diagnosis and cell typing, it detect single-nuclectide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide SEQ ID NO 235169 for detecting SNP TSC0057429.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 235169; 29pp + Sequence Listing; German.

central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABC00100-ABF99899, ABC00100-ABF99899, ABC00100-ABF99899, ABC00100-ABF99899 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but two obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prereated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABF00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                          vec or oligonucleotides, useful for diagnosis and cell typing, i
designed to detect single-nucleotide polymorphisms and cytosine
methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide SEQ ID NO 88771 for detecting SNP TSC0022307.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABC0010-ABE9989, ABC0010-ABE9989, ABC0010-ABE9989, ABC0010-ABE9989, and ABI00010-ABE82073 data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABE99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99889, ABF00010-ABF99889 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and oycosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at

This invention describes novel oligonucleotide primars or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE99989, ABF00010-ABE99989, ABH00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
                                                                                                                                                              Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 263070; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, aradiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE9989, ABF00010-ABE9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF0010-ABF9989, ABH0010-ABH99999 and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but type int/pub/published_pct_sequences

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK22770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocoellular carcinoma, HCV infection, drug therapy, type I interferon; interferon alpha, interferon beta; cytostatic, interferon gamma; consensus interferon, hepatotropic; antiinflammatory, substrate; hammerhead ribozyme, HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus substrate #717 for HCV hammerhead ribozyme #717.
                                                                                                                                                                                                               New human nucleic acid containing specific SAGE tags, useful as diagnostic markers for cancer, also derived probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pavco PA, Macejack D;

The present invention relates to enzymatic nucleic acids which specifically volave RNA derived from Hepatitis C virus (HCV). The specifically volave RNA derived from Hepatitis C virus (HCV). The nazymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV incomplete accomplete to treat circhosis, liver failure and/or hepatocellular carcinoma. The HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially confection in conjunction with one or more sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the chained in electronic format directly from the USPTO web site at sequence complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The coligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF89999, ABH00010-ABH99989 and ABI00010-ABI82073
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to single mucleotide polymorphisms in the gene encoding the human v-fos FBJ murine osteosarcoma viral oncogene homologue (FDS) polypeptide. A method for haplotyping the FOS gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the Ryb haplotype pairs can be sesigned to specific genotypes. An association between a trait and a haplotype or haplotype pair in a population exhibiting the trait with the FOS gene can be identified by comparing the frequency of the haplotype or haplotype pair. FOS and its associated with the haplotype or haplotype 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

The invention comprises the DNA and amino acid sequence of the human lipase, endothelial (LIPG) isogene. Specifically, the invention relates to the discovery of 20 novel polymorphic sites within the LIPG gene. The LIPG coding sequence and protein are useful for screening drugs that can be used to treat atherosclerosis and other cardiovascular disorders. The LIPG coding sequence can also be used to haplotype and genotype the LIPG gene of an individual. The DNA sequences ABL91822 - ABL91881 represent LIPG gene allele specific oligonucleotide primers
                                                          Human, ss, allele specific oligonucleotide; primer; single nucleotide polymorphism; SNP; lipase endothelial isogene; LIPG; drug screening; aheroselerosis; cardiovascular disorder; LIPG the haplotyping; LIPG genotyping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel genetic variants of Lipase, Endothelial isogenes, useful for improving efficiency and reliability in drug development for treating diseases associated with LIPG activity, e.g. atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, colon cancer, colorectal cancer, pancreatic cancer, SAGE tag; serial analysis of gene expression, diagnostic, prognostic, probe;

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the HepatitisC virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the cleavage sites and their activities optimised by either varying the uncleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatotis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid; hammerhead ribozyme; virus replication; cleavage; cirrhosis; liver failure; hepatocellular carcinoma; interferon; cancer; autoimmune disease; ss.
being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ç

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human small inducible cytokine A1-1309 (SCYA1) gene located on chromosome 17, and methods for haplotyping and/or genotyping the SCYA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the SCYA1 gene polymorphisms. The polymucleotides and screened compounds are useful for the treatment of polymorpectides associated with SCYA1 activity, such as atheroscierosis, human immunodeficiency virus (HIV) infection, and other inflammatory disorders. AAS14438-AAS14455 represent ASO primers for detecting human SCYA1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genotyping human small inducible cytokine Al-I-309, homologous to mous
Tca-3 gene of individual, involves determining identity of nucleotide
pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and range of diseases including immune system, gastroin estinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99889, ABF0010-ABE99889 and ABI0010-ABE9980 and ABI0010-ABE9073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

```

Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenceis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method

Claim 179; Page 174; 259pp; English.

```
comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising caradom sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with care used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic acide and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV93877 repersent NACs that can be used in the control of the Raf gene activity. AAV90922 to AAV93877 repersesion of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of isolated gene transcripts - useful for developing products for diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tag sequence; colorectal cancer; pancreatic cancer; colon cancer; diagnosis; prognosis; treatment; ss.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form mar of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                             acid (PRA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diseases and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABF09989, ABF00010-ABF99989 and ABI0010-ABF2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                 oet or oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis, atopby dermatitis, and, supparently and string skin rosaces, melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
response to vaccination and/or therapy, in cancer immunoprophylaxis, immunotherapy and diagnosis, and monitoring of tumor progression or regression, and to produce large quantities of readily purified antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prefraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disonders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The invention comprises the DNA and amino acid sequence of the human lipase, endochelial (LIPG) isogene. Specifically, the invention relates to the discovery of 20 novel polymorphic sites within the LIPG gene. The LIPG coding sequence and protein are useful for screening drugs that can be used to treat atherosclerosis and other cardiovascular disorders. The LIPG coding sequence can also be used to haplotype and genotype the LIPG gene of an individual. The DNA sequences ABL91862 - ABL91901 represent
                                                 Novel genetic variants of Lipase, Endothelial isogenes, useful for improving efficiency and reliability in drug development for treating diseases associated with LIPG activity, e.g. atherosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to modified human thymic stromal lymphopoietin (TSLP) protein and polymucleotide sequences. TSLP protein is useful for stimulating lymphocyte proliferation of lymphopoiess, or inducing STATS. TSLP DNA is useful for producing a furin-resistant polypeptide having at thest one functional human TSLP activity. The invention is useful in the manufacture of a medicament for stimulating lymphocyte proliferation, for promoting lymphocyte proliferation, for promoting lymphopoiesis, or for inducing phosphorylation of STATS. It is also useful as a vaccine for treating ALDS, autoimmune diseases (e.g. transplant rejection), or bacterial or viral infections. The present sequence is human TSLP furin cleavage site peptide encoding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1) ss; primer; extension oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invetion relates to producing a recombinant replicable vesiculovirus. The method involves culturing a cell containing a first recombinant nucleic acid that can be transcribed to produce an RNA comprising a vesiculovirus antigenomic (+) RNA containing the vesiculovirus promoter for replication and a ribozyme sequence immediately downstream the antigenomic (+) RNA. The method is useful for producing recombinant replicable vesiculoviruses, which can be used as vaccines for the treatment or prevention of infections by a pathogenic microorganism. The recombinant replicable vesiculoviruses are useful in diagnosing and monitoring progression of infectious disorders, including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhaed (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat crithosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more context of sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: sequence capte for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPPO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                            New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin of enzymatic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin of the substrate sequences defined in the specification. The HCV concluding the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hopatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more acondition associated with HCV infection in conjunction. The present sequence represents a substrate for a HCV harmerhead (HH) ribozyme. Note: Some of the sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thymic stromal lymphopoietin; TSLP; lymphopoiesis; STATS; antibacterial; furin-resistant protein; lymphocyte; vaccine; AIDS; autoimmune disease; transplant rejection; infection; immunosuppressive; immunostimulant;
                                                                                                                                                                                    New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /product= "Human TSLP furin cleavage site peptide"

Macejak D;

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the describtor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatities C virus (HCV) infection, e.g. cirthosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune Sequence 15 BP; 0 A; 5 C; 2 G; 0 T; 8 U; 0 Other; diseases, and cancer Query Match

Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFB3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea, ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense alignouclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, robar, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Gaps ; 0 46.4%; Score 10.2; DB 1; Length 15; 80.0%; Pred. The sequences given in AAQ74218-34 are primers which were used in the extraction of viral RNA and cDNA synthesis of genes from type A and type B influenza virus RNA. The first strand of cDNA from type A and type B influenza virus RNA. The first strand of cDNA from thype A genes was maplified using a primer which is complementary to a conserved region located at the 3' terminus of the viral RNA for all A strain genes. A separate set of primers was required for amplification of genes from B/Panama/45/90 as it does not have common sequences at each end of viral RNA. The amplifies sequences were inserted into the expression plasmid VIJns is an expression vector which expression plasmid VIJns is an expression of an antigenic influenza virus genes, capable of inducing the expression of an antigenic influenza virus gene product which induces a specific immune response upon introduction of the DNA construct into animal tissue in vivo and resultant uptake of the DNA construct by cells which express the encoded influenza gene. These vectors act as polymucleotide vaccines, which induces neutralising antibodies against human influenza virus. The encoded influenza virus cantibodies against human influenza virus. The encoded influenza virus cart as polymucleotide vaccines, which induces meutralising antibodies against human influenza virus. The encoded influenza virus gene encodes nucleoprotein, hemaglutinin, polymerase, matrix or nonstructural human influenza virus gene products. The virus gene is coperably linked to one or more control sequences for incorporation in the control of the products of th

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves can the pate position given in the descriptor line. The HVV sequence at the base position given in the descriptor line. The HVV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the carget these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis curinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

728 GCCAGGAGAAC 739

The present sequence is a probe used in a method for monitoring antihepatitis B virus (HBV) drug resistance in a patient by genetic detection of any one of mutations L528M, M552V/I and/or V/L/M551 in HBV DNA polymerase in a biological sample from the patient. The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and precise

                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BR1, inhibitor CHLR2, AF6. BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incleance of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                  Novel polypeptides that are the regulators of BRCA-1, useful for treating cancer and diagnosing the presence of neoplastic cells in biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monitoring anti-HBV drug resistance by genetic detection of mutations in DNA polymerase of HBV in patient's sample, involves hybridizing the polymucleic acids of the sample with a probe and detecting the hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hepatitis B virus; DNA polymerase gene; anti-HBV drug resistance;

The method comprises assaying for the presence of human rhinovirus using a fluorogenic real time PCR assay. The present sequence is a PCR primer for human rhinovirus, used to illustrate the method of the invention. This sequence is complementary to the antisense RNA at position 169 to 184 in the 5' non-coding region of RV1b. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Predicting the likelihood of a patient suffering an onset of chronic obstructive pulmonary disease exacerbation by assaying for a virus, particularly a picornavirus allows management of the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pck primers AAX01274-75 were used in a RT-PCR to amplify a 180 bp dragment of the 5' untranslated region (UTR) of Picornavirus, which can detected using probe AAX01276. The primers are used in the method of the invention. The specification describes a new method for obtaining cDNA derived from multiple RNA respiratory pathogens present in cells from a producing obtained. The method comprises extracting RNA from the cells, producing cDNA by reverse transcribing the RNA using pooled short oligonucleotides of random sequence and PCR amplifying the cDNA by using pathogens. The oligonucleotides specific to two or more RNA respiratory pathogens. The oligonucleotides are useful for obtaining and disgnosing multiple RNA pathogen infections, especially single-stranded RNA viruses which cause pneumonia, common cold, exercise induced bronchoconstriction (EIB) and asthma
                                                                                  RNA respiratory pathogen; common cold; multiple RNA pathogen infection; single-stranded RNA virus; picoromavirus; parainfluenza; respiratory syncytial virus; pneumonia; EIB; asthma; exercise induced bronchoconstriction; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection and diagnosis of multiple RNA respiratory pathogens - using pooled random sequenced oligonuclectides as primers for reverse transcription.

Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridsation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BR1, inhibitor dominant negative 4 (ID4), breast basic conserved protein 1 (BBC1), CHLR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incidence of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1 sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                                                                                                  Novel polypeptides that are the regulators of BRCA-1, useful for treating cancer and diagnosing the presence of neoplastic cells in biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, BRCA-1 regulator, ribozyme, BR1, RNA target recognition, probe, cytostatic, RNA cleavage, tumour suppressor; PCR primer, CHLR2, AF6, BR2, inhibitor dominant negative 4, breast basic conserved protein 1, BBC1; BR3; ID4; cancer, proliferative disorder, tumour proliferation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to nucleic acid molecules which modulate the gravites is, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmer-head ribozymes, DNAzymes, anceives, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HBV enzymatic nucleic acid sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
 degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Lee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability; RNA expression, RNA synthesis, antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication;

The invention relates to a novel isolated polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for the purinergic receptor P2Y. G-protein coupled, 1 (PSRY1) protein or its fragment. The polymorphic variant comprises one or more variant amino acids selected from valine at a position 34 and glycine at a position for a polymorphic variants are useful in studying the expression and function of P2RY1, in expressing P2RY1 protein for use in screening for candidate drugs to treat diseases related to P2RY1 activity, in studying the effect of the variation on the biological activity of P2RY1, and the binding affinity of candidate drugs targeting P2RY1 for the treatment of disorders related to platelet aggregation. The hablotyping methods are
                                                     The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human dynein, axonemal light polypeptide chain 4 (DNAL4) gene located on chromosome 22q13.1, and methods for haplotyping and/or genotyping the DNAL4 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the DNAL4 gene polymorphisms. The polymorphisms and screened compounds are useful for the treatment of diseases associated with DNAL4 activity, such as neurological disorders. AAS19907-AAS19920 represent ASO probes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New purinergic receptor P2Y G-protein coupled 1 (P2RV1) gene polymorphic variants, useful e.g. in studying the expression and function of P2RV1 and screening candidate drugs for treating diseases related to P2RV1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Purinergic receptor P2Y, G-protein coupled 1; P2RY1; anticoagulant; coagulant; platelet aggregation; haplotyping; drug screening; transgenic animal; human; allele-specific oligonucleotide; ss.

condition or disease predicted to be associated with P2RYI activity, or specific condition or disease associated with P2RYI activity, or specific condition or disease associated with P2RYI activity. The transgenic animals are useful for studying expression of the P2RYI isogenes in vivo, for in vivo screening and testing of drugs targeted against P2RYI protein, and for testing the efficacy of the P2RYI and compounds for disorders related to platelet aggregation in a biological system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           colon and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer
                                                                                                                                                                                                                                                                              Gaps

The invention relates to a novel human 6-phosphofructo-2-kinase/ fructose -2,6-biphosphatase 2 (PFKBE2) isogene. The PFKFB2 of the invention has yetostatic and antidiabetic activity. The polymoleotides may have a use in gene therapy. The identified candidate agents targeting PFKFB2, are useful for treating cancer and diabetes. The methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with PFKFB2 activity. The present sequence represents a allele specific oligonucleotide (ASO) probe used in the invention to detect PFKFB2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genotyping human dynein, axonemal light polypeptide chain 4 gene of individual, useful for determining haplotype of individual, comprises determining identity of nucleotide pair at specific polymorphic sites for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, single nucleotide polymorphism; SNP; DNAL4; chromosome 22q13.1;
dynein axonemal light polypeptide chain 4; haplotyping; genotyping;
neuroprotective; neurological disorder; allele-specific oligonucleotide;
                                                                                                                                                                                                  New 6-phosphofruoto-2-kinase/fructose-2,6-bisphosphatase 2 (PFKFB2) gene variants, for improving efficiency and reliability in the development of drugs for treating diseases associated with PFKFB2 activity e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ASO probe #7 to detect human DNAL4 gene polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 15 BP; 6 A; 4 C; 3 G; 1 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel polymucleotide sequence which is a polymorphic variant of a reference sequence for the cofilin 1 (nonmuscle) (CFL1) gene or its fragment, or a polymorphic variant of a reference sequence for a CFL1 DNA or its fragment. The polymucleotide of the invention may have a use in gene therapy, and in antisense gene therapy. The polymucleotide is useful for studying the expression and function of CFL1 and expressing CFL1 protein for use in screening function of CFL1 and expressing CFL1 protein for use in screening polymorphism and haplotype data are useful for validating whether CFL1 is a suitable target for drugs to treat immunological disorders, screening for such drugs and reducing bias in clinical trials of such drugs. The present sequence represents one of a set of allele-specific oligomucleotide (ASO) PCR primer used in the invention to detect
                                                                                                                                                                                                                                                                                                                                                                                                                             Novel genetic variants of human cofilin 1, CFL1 gene for studying expression, function of the gene and expressing CFL1 protein useful in identifying drugs to treat immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 2; PFKFB2; cytostatic; antidiabetic; gene therapy; cancer; diabetes; ss; ASO; allele specific oligonucleotide; probe; polymorphism.

The tag sequences can be used to identify genes by matching the tag to a gen date base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can stop be used in a method for diagnosing oolon or pancreatic cancer in a sample suspected of being neoplastic. The method comparises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the
sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31315. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of isolated gene transcripts - useful for developing products for diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.

The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the IMPDH2 gene polymorphisms. The polymorphical desares associated with IMPDH2 such (developing) treatment of diseases associated with IMPDH2 activity, such as cancer. AAS18254-AAS18279 represent ASO primers for detecting IMPDH2
                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide having polymorphic variant of IMP2 dehydrogenase gene, useful for studying expression of the gene in vivo, and for testing efficacy of therapeutic agents for cancer in biological

The present sequence represents a preferred target sequence for an enzymatic nucleotide acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)

Pape M;

New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.

Claim 4; Page 41; 72pp; English.

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-T50546). CETP is a 74 kD glycoprotein that facilitates neutral lipid

AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a

Claim 2; Page 30; 120pp; English.

transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then binds to 5 nucleotides either side of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosclerosis, familial hyperbetalipoproteinaemia, peripheral vascular disease, dyslipidaemia, hyperbetalipoproteinaemia, hyposlphalipoproteinaemia, wascular complications of diabetes, transplant, atherectomy and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes con also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes con also be used the CETP gene, they have low non-specific ó Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3-SEP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-SEP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-SEP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3-SEP-1
The present invention describes a recombinant adeno-associated virus (AAV) vectored ribozyme composition (I). (I) comprises: (a) at least a first tibozyme that specifically cleaves an mRNA encoding a protein, copypeptide, or peptide selected from the group of rod opsin, iNOS, calpha 1, integrin alpha 3, integrin alpha 5, or integrin alpha V, (b) a corrector comprising a polynucleotide encoding the ribozyme, where the polynucleotide encoding the ribozyme, where the polynucleotide operably positioned downstream of at least a first or promoter that directs expression of the polynucleotide in a selected comprising the ribozyme or the polynucleotide; (d) an AAV vector comprising the ribozyme or the polynucleotide; (d) an AAV vector comprising the ribozyme or the polynucleotide; or (e) a host cell comprising the ribozyme or the polynucleotide; or (e) a host cell comprising the ribozyme or the polynucleotide; or (e) a host cell comprising the ribozyme or the polynucleotide; or (e) a host cell comprising the ribozyme or the polynucleotide; or (e) a comprising the ribozyme or the polynucleotide; or (e) a comprising the ribozyme or the polynucleotide. Also described is a method comprising the ribozyme or the polynucleotide. Also described is a method comprising the ribozyme, and for a time effective to specifically cleave the mRNA in the cell. (I) can be used for treating a disease or retinal compathy or (dasertinal dasers) and conderention of the mammalian eye, such as a retinal disease or retinal cystumention. (I) is also useful for manifacturing a medicament for treating the diseases mentioned above, including autosomal dominant cretinities or a blood-retinal barrier dysfunction. (I) can also be useful for treating the diseases mentioned above, including autosomal dominant cretinities or a blood-retinal barrier dysfunction. (I) can also be useful for treating the disease mentioned above, including autosomal dominant cretinities or a blood-retinal barrier dysfunction of the encoding of compatible of the disease of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                 Hairpin ribozyme; hammerhead ribozyme; ribozyme; retinal disease; target; ophthalmological; gene therapy; eye; retinal dysfunction; AAV; diabetic retinopathy; mecular degeneration; autosomal dominant retinitis; blood-retinal barrier dysfunction; adeno-associated virus; blindness; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A recombinant adeno-associated virus-vectored ribozyme composition, useful for treating a disease or dysfunction of the mammalian eye e.g. retinal disease, e.g. diabetic retinopathy or age-related macular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

They are used especially for the treatment of the immunosuppressive effect of TGF-beta, augmentation of tycotoxic lymphocytes, treatment of endogenous thyperexpression of TGF-beta, treatment of breast tumours, neurofibromas and malignant gliomas, including glioblastomas, treatment and prophylaxis of skin carcinogenesis, and treatment of oesophageal and gastric carcinomas. See AAQ78352-Q78488. The sequences given in GENESEO files AAQ78352-Q78408 are antisense oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a universal molecular Turing machine comprising a circular DNA molecule, having sites representing information storage of the Turing machine, having sites representing information storage of the Turing machine, having sites representing information (Inv) restriction site also inside the circular DNA molecule, and adjacent to the Inv restriction site; a current symbol, encoded on the circular DNA molecule at a distance from the state restriction site; a sequence of intervening nucleotides between the state restriction site and the current symbol; a set of the asymmetric restriction as each of asymmetric restriction asymmetry as to the current symbol; a set of asymmetric restriction and not of the current symbol; a set of transition oligonucleotides, which are inserted into the dircular DNA molecule as additional symbols to encode changes to the information storage caused by operation of the Turing machine. The Turing machine is a model of computation. The universal molecular Turing machine is capable of simulating any Turing machine is a model of simulating any Turing machine is a simulating and molecular machine is capable of simulating machine is a simulating and molecular machine is capable of simulating machine in the simulating machine is capable of simulating machine is capable of simulating machine is capable of simulating machine in the simulat

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disponsis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                              i.s
                   Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABF82073 data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide SEQ ID NO 173165 for detecting SNP TSC0006888.
